

Jaggo bandar mast kalandar, Prompt craft final round
Again we guys used Gemini to build the lost n found AI
chat link- <https://gemini.google.com/share/b21919fa6fc0>

1. Inserted the pdf sent , final-problem-statement.pdf, make it.
2. start with the front end
3. do it on canvas
4. first ask the user to sign in
5. after the user sign in or sign up show the homepage after a cool transition page
6. now create a database to store previous and new user info
7. fix this error

8. now add settings app where user will manage their accounts, log out (in red font), allow user to change their theme
9. now add system, where if a user finds his lost item, he will click on the item, and tell it is his, and then there will be a transition page to page where it will tell the user where to collect it from, and then move the item from lost to found and add the user's name who collected it
10. it keeps loading indefinitely, fix it
11. remove database shit for now
12. dont add initial items yourself, we will see those later
13. add a field in found item, where the finder will type where to collect the items from

14. add an ai agent named Sherlock Holmes
15. add ai agent named 404 found
16. let our ai agent named 404 found handle lost items too
17. https://www.iiitb.ac.in/includefiles/pages/icons/IIITB_logo1.jpg
add this logo, and make it title IIITB lost and found
18. now give our ai agent ability to handle both lost and found
19. now when the user sign in or log up add a transition like the the animation of the intial page going away and our homepage booting up'
20. now the email address should always end it iiitb.ac.in, and password should contain atleast lowercase, uppercase, numeric, and special symbols

ai agent's name is not 404 found anymore, his name is Alex
